## Johnstone Laboratory Resource

## Concentrations of Aqueous Acid and Base Solutions

Many laboratory reagents are commonly supplied as aqueous solutions in "concentrate form" with the concentration provided as a wt\%. This situation most commonly arises because of how these reagents are prepared. For instance, no one probably wants an $\mathrm{HCl}_{(\text {aq) }}$ solution that is specifically at $37 \mathrm{wt} \%$ ( 12.18 $\mathrm{M})$, but this is the highest concentration that is readily obtainable by dissolving $\mathrm{HCl}_{(\mathrm{g})}$ in water under ambient conditions. Note that higher concentrations are possible. Below are the molar concentrations of common "concentrated" aqueous reagents whose concentrations are usually specified in wt\% along with the densities used to calculate those concentrations.

| Reagent | $\mathbf{w t \%}$ | Density | Molarity |
| :--- | :--- | :--- | :--- |
| HCl | $37 \%$ | 1.18 | 12.2 |
| HF | $49 \%$ | 1.19 | 28.9 |
| $\mathrm{HNO}_{3}$ | $70 \%$ | 1.41 | 15.6 |
| $\mathrm{H}_{3} \mathrm{PO}_{4}$ | $85 \%$ | 1.71 | 14.8 |
| $\mathrm{HClO}_{4}$ | $70 \%$ | 1.67 | 11.7 |
| $\mathrm{H}_{2} \mathrm{SO}_{4}$ | $98 \%$ | 1.84 | 18.4 |
|  |  |  |  |
| $\mathrm{NH}_{3}$ | $25 \%$ | 0.91 | 13.4 |
| $\mathrm{NH}_{3}$ | $28 \%$ | 0.90 | 14.5 |
| $\mathrm{NH}_{3}$ | $35 \%$ | 0.88 | 18.1 |
| $\mathrm{H}_{2} \mathrm{O}_{2}{ }^{* *}$ |  |  |  |

** Care should be taken with all of these concentrations because the wt\% of these reagents as supplied is often approximate. Particular care should be taken with $\mathrm{H}_{2} \mathrm{O}_{2}$ because it decomposes slowly over time.
